Introduction

This report documents Part 02 of the website development for Fresh Bite Cafe. Part 01 focused on the HTML structure and planning, while Part 02 focuses on styling the website for desktop using CSS, implementing responsive design for mobile and tablet devices, and managing the project through a GitHub repository. The report explains the CSS styling approach, the responsive techniques applied including breakpoints, relative units and responsive images, and the testing process used to ensure the site works across different screen sizes.

3.1 Breakpoints:

Three key breakpoints were identified for the website: mobile (<768px), tablet (768px and above), and desktop (1024px and above). CSS media queries were used to apply specific styles at each breakpoint (Mozilla Developer Network, 2026). On larger screens, a multi-column layout using Flexbox is implemented, which switches to a single-column layout on smaller screens. Content layout, font sizes, and navigation were modified for each breakpoint, for example the navigation stacks vertically on mobile and displays horizontally on tablet and desktop.

3.2 Relative Units:

Relative units were used throughout the stylesheet to ensure responsiveness. Font sizes and spacing were defined using em and rem instead of fixed pixels, allowing text to scale proportionally with the root font size. Percentage (%) units were used for widths and heights, for example width: 100% on the main container and images, so elements resize fluidly to fit their parent container on any screen size (W3Schools, 2026).

3.3 Responsive Images:

To optimize image loading across devices, the srcset and sizes of attributes were used to provide different image resolutions for different screen sizes, allowing the browser to select the most appropriate file. The element was also considered for art direction on smaller viewports. All content images were set to max width: 100%; height: auto; to prevent overflow and ensure they scale down proportionally on mobile devices.

3.4 Test and Iterate

Browser developer tools (Chrome DevTools Device Toolbar) were used to test the website on different devices and screen sizes. The layout was checked at 375px (mobile - iPhone SE), 768px (tablet - iPad Mini), and 1280px (desktop) to ensure content reflows correctly with no horizontal scrolling. Screenshot evidence of the three screen sizes is included in the README document, showing desktop, tablet, and mobile views. The design was continuously tested and iterated, for example adjusting navigation spacing and font sizes at the tablet breakpoint, to ensure optimal user experience across all devices (Google Chrome Developers, 2026). I used CSS media queries with breakpoints at 768px and 1024px to ensure Fresh Bite Cafe displays correctly on mobile, tablet, and desktop.

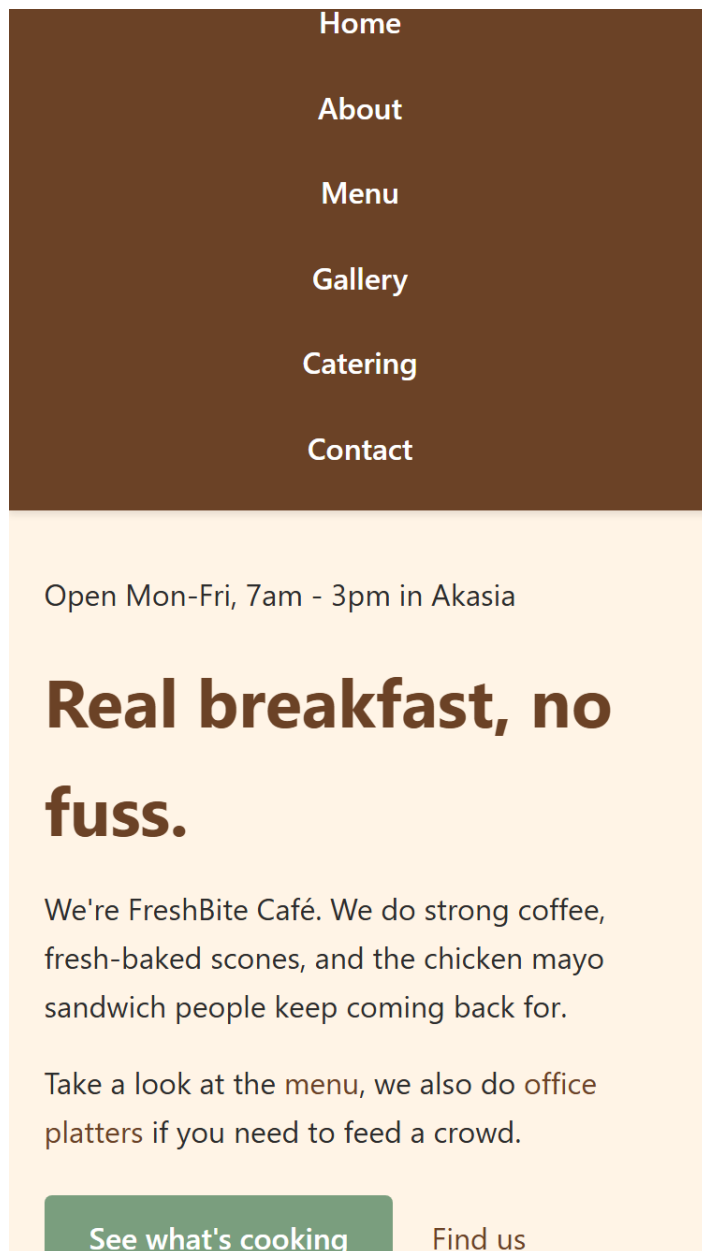

Figure 1: Mobile view (375px- iPhone SE)

The layout collapses to a single column with stacked navigation accessed via the hamburger menu. Font sizes and button padding are increased for touch interaction, and images scale to 100% width to prevent horizontal scrolling.

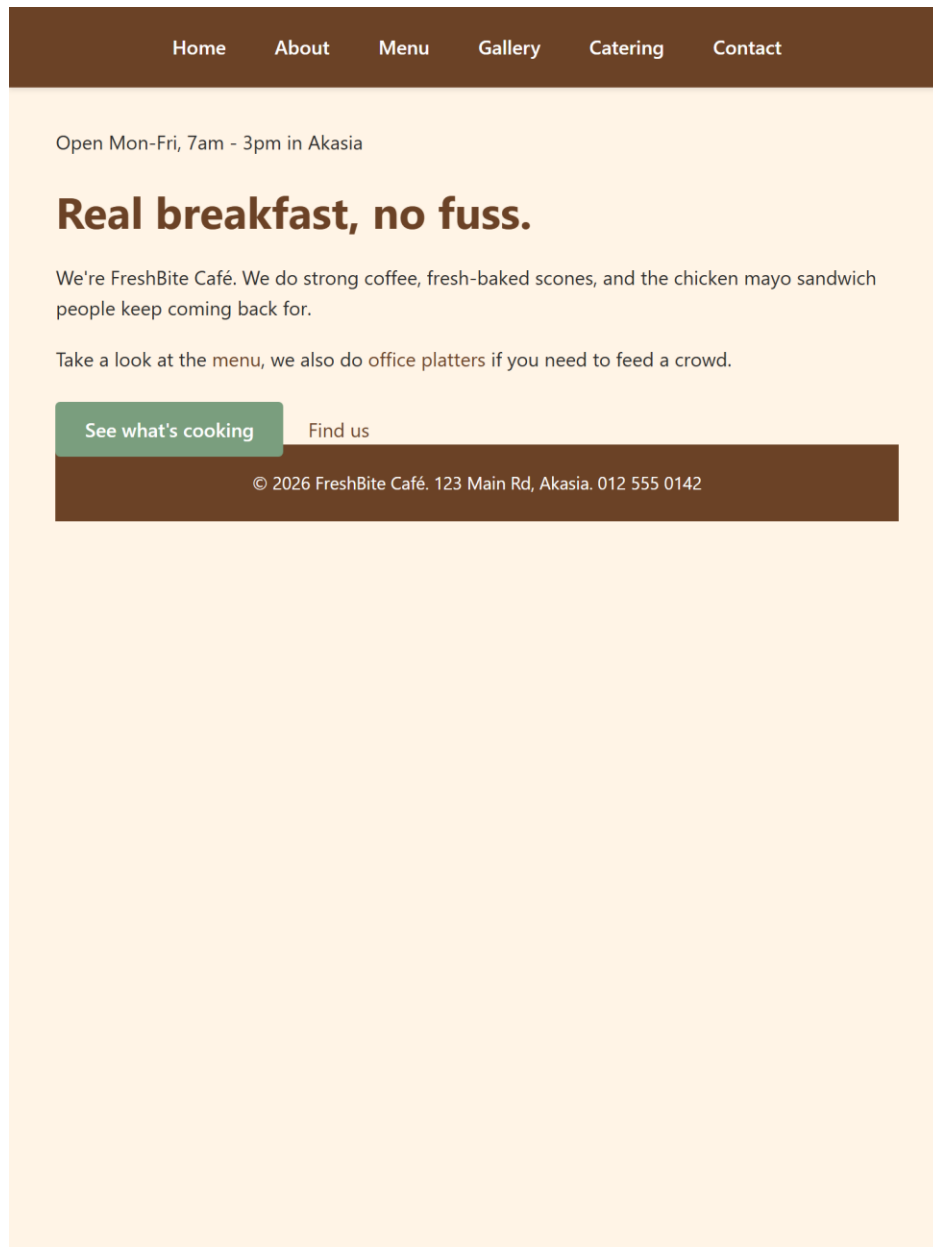

Figure 2: Tablet view (768- iPad Mini)

A two-column grid is applied at the 768px breakpoint, allowing menu items to display side-by-side while maintaining readability. The navigation bar expands to show full links, and spacing is adjusted to utilize the wider viewport.

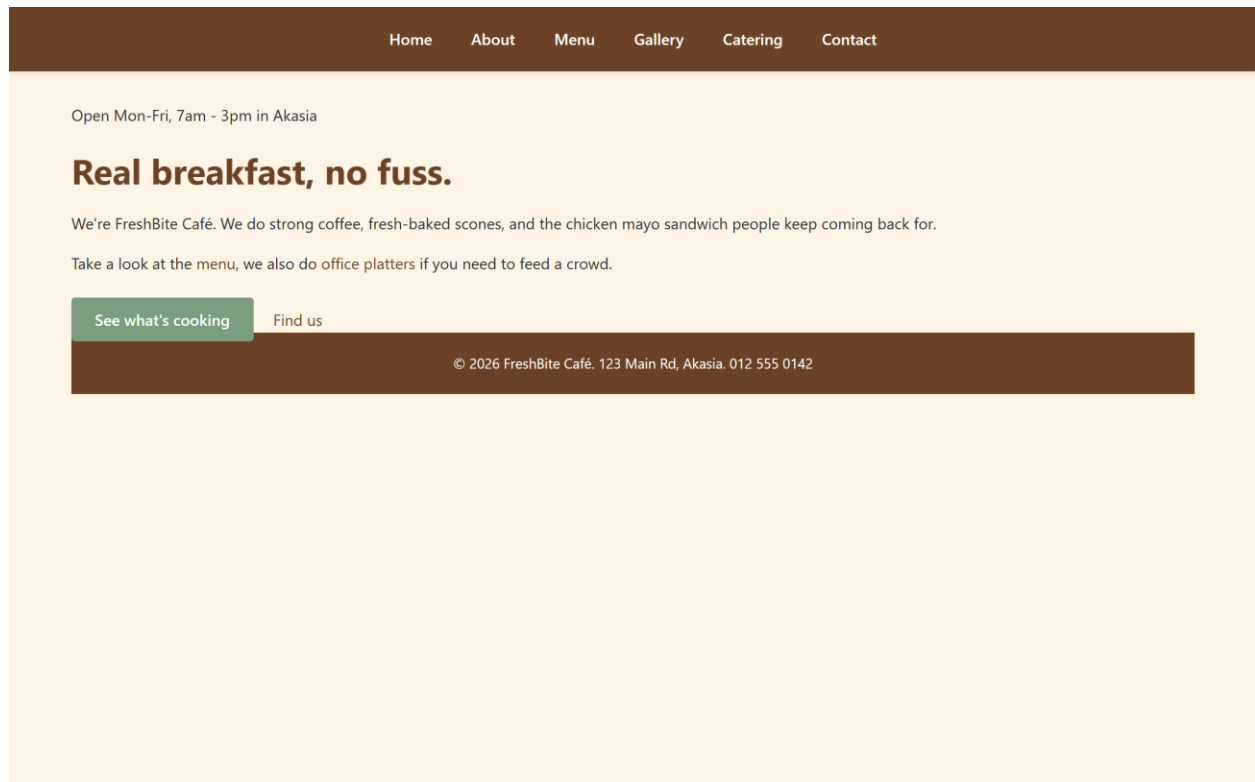

Figure 3: Desktop view (1200px+)

The full three-column layout is displayed with complete horizontal navigation, hero section and footer visible without scrolling. Media queries at 1024px enable hover effects and larger container widths to make use of the available screen space.
